

Lambda Calculus

Your Favorite Language

Probably has lots of features:

- Assignment ($x = x + 1$)
- Booleans, integers, characters, strings, ...
- Conditionals
- Loops
- return, break, continue
- Functions
- Recursion
- References / pointers
- Objects and classes
- Inheritance
- ...

Which ones can we do without?

What is the smallest universal language?

Handwritten notes on the history of Lambda Calculus, including the work of Alonzo Church and Alan Turing.

What is computable?

Before 1930s

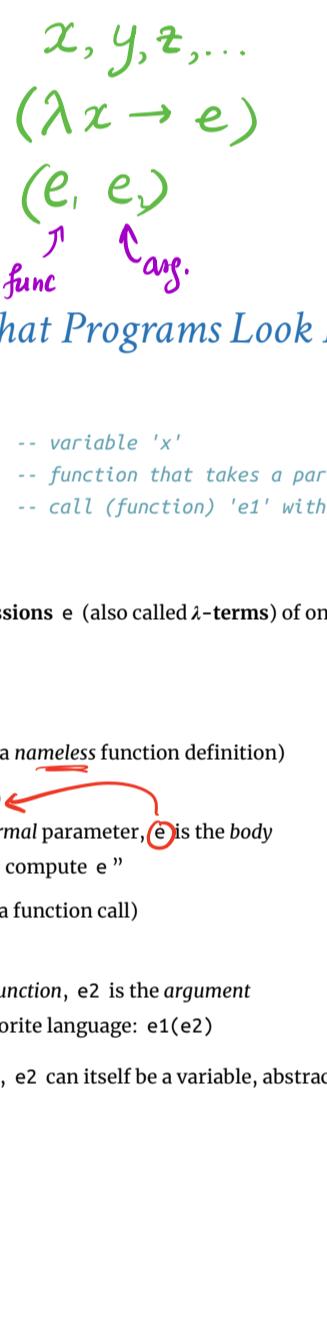

Informal notion of an effectively calculable function:

$$\begin{array}{r} 172 \\ 32 \overline{) 5612} \\ 32 \\ \hline 231 \\ 224 \\ \hline 72 \\ 64 \\ \hline 8 \end{array}$$

can be computed by a human with pen and paper, following an algorithm

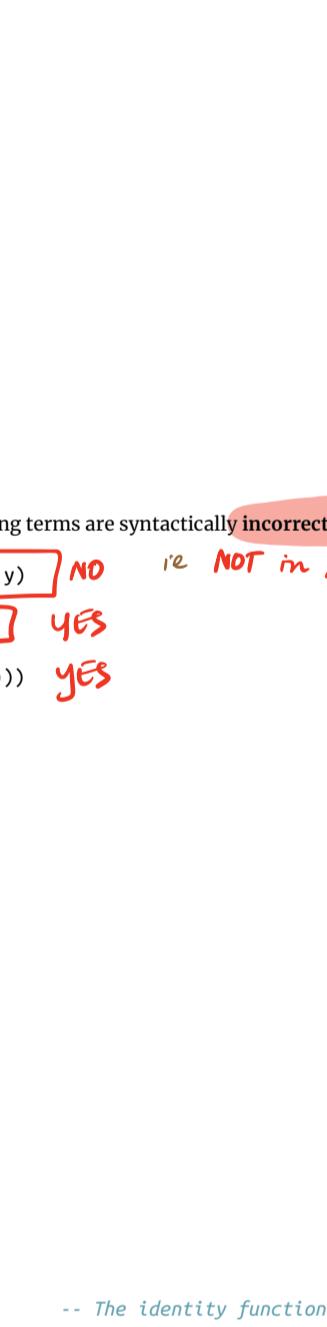

1936: Formalization

What is the smallest universal language?

UK (Cambridge)

Alan Turing

Alonzo Church

The Next 700 Languages

Peter Landin

Whatever the next 700 languages turn out to be, they will surely be variants of lambda calculus.

Peter Landin, 1966

QUIZ

Which of the following term are not in *normal form*?

A. $\lambda x. \text{NP}$ $(\lambda z \rightarrow z) y$

B. $(\lambda x y. \text{NF})$ not

C. $(\lambda (x \rightarrow x) y)$ NF

D. $(\lambda x. (\lambda y. \text{y}))$ NF [post-lecture edit!]

E. C and D NF also NF

Semantics: Evaluation

λ -term e evaluates to e' if

1. There is a sequence of steps $e \Rightarrow e_1 \Rightarrow \dots \Rightarrow e_N \Rightarrow e'$ where each \Rightarrow is either \Rightarrow or \Rightarrow and $N \geq 0$
2. e' is in *normal form*

Exercise: Evaluation

Examples of Evaluation

$((\lambda x \rightarrow x) \text{apple})$

$\Rightarrow \text{apple}$

$\Rightarrow \text{apple}$

Elsa shortcuts

Named λ -terms:

`let ID = $(\lambda x \rightarrow x)$ -- abbreviation for $(\lambda x \rightarrow x)$`

To substitute name with its definition, use a \Rightarrow step:

`let ID = $(\lambda x \rightarrow x)$
= $\Rightarrow (\lambda x \rightarrow x) \text{apple}$ -- expand definition
= $\Rightarrow \text{apple}$ -- beta-reduce`

Evaluation:

- $e_1 \Rightarrow e_2$: e_1 reduces to e_2 in 0 or more steps
 - where each step is \Rightarrow , \Rightarrow , or \Rightarrow
- $e_1 \Rightarrow e_2$: e_1 evaluates to e_2 and e_2 is in *normal form*

EXERCISE

Fill in the definitions of `FIRST`, `SECOND` and `THIRD` such that you get the following behavior in `Elsa`

`let FIRST = $\lambda x. \text{this_in } x$ $\lambda x_1 \rightarrow \lambda x_2 \rightarrow \lambda x_3 \rightarrow \text{apple}$
let SECOND = $\lambda x. \text{this_in } x$ $\lambda x_1 \rightarrow \lambda x_2 \rightarrow \lambda x_3 \rightarrow \text{banana}$
let THIRD = $\lambda x. \text{this_in } x$ $\lambda x_1 \rightarrow \lambda x_2 \rightarrow \lambda x_3 \rightarrow \text{orange}$`

$\Rightarrow \text{apple}$

$\Rightarrow ((\text{SECOND } \text{apple}) \text{banana}) \text{orange}$

$\Rightarrow \text{banana}$

$\Rightarrow ((\text{THIRD } \text{apple}) \text{banana}) \text{orange}$

$\Rightarrow \text{orange}$

Non-Terminating Evaluation

$((\lambda x \rightarrow (x x)) (\lambda x \rightarrow (x x)))$

$\Rightarrow \text{b} \rightarrow ((\lambda x \rightarrow (x x)) (\lambda x \rightarrow (x x)))$

Some programs loop back to themselves... never reduce to a normal form!

This combinator is called Ω

Example: Branches step-by-step

Now you try it! Can you fill in the blanks to make it happen?

`let ITE_TRUE = $\lambda e_1 e_2. e_1$ -- if true then e_1 else e_2`

`let ITE_FALSE = $\lambda e_1 e_2. e_2$ -- if false then e_2 else e_1`

`let NOT = $\lambda e. \text{not } e$ -- not operator`

`eval ex_true_f: $\text{NOT } \text{TRUE} \Rightarrow \text{FALSE}$`

`eval ex_false_f: $\text{NOT } \text{FALSE} \Rightarrow \text{TRUE}$`

`eval ex_and_f: $\text{AND } \text{TRUE } \text{TRUE} \Rightarrow \text{TRUE}$`

Programming in λ -calculus

- Booleans [done]
- Records (structs, tuples) [done]
- Numbers
- Lists
- ✓ Functions [we got those]
- Recursion

$\text{“}3\text{”} \quad \lambda f x\ .\ f (f (f x))$
 $\text{“}1\text{”} \quad \lambda f x\ .\ f x$
 $\text{“}2\text{”} \quad \lambda f x\ .\ f (f x)$
 $\text{“}n\text{”} \quad \lambda f x\ .\ f (\underbrace{\dots}_{n} f x)$

λ -calculus: Numbers

Let's start with natural numbers (0, 1, 2, ...)

What do we do with natural numbers?

- Count: 0 , inc
- Arithmetic: dec , + , - , *
- Comparisons: == , <= , etc

Natural Numbers: API

We need to define:

- A family of numerals: ZERO , ONE , TWO , THREE , ...
- Arithmetic functions: INC , DEC , ADD , SUB , MULT
- Comparisons: IS_ZERO , EQ

Such that they respect all regular laws of arithmetic, e.g.

$\text{IS_ZERO ZERO} \Rightarrow \text{TRUE}$
 $\text{IS_ZERO (INC ONE)} \Rightarrow \text{FALSE}$
 $\text{INC ONE} \Rightarrow \text{TWO}$
 \dots
 $\text{INC} = \lambda n \rightarrow \underline{\underline{?}}$

λ -calculus: Increment

$\text{-- Call ‘f’ on ‘x’ one more time than ‘n’ does}$

$\text{let INC = } \underline{\underline{\lambda n\ .\ \underline{\underline{\lambda f\ .\ f\ (\underline{\underline{\lambda x\ .\ f\ (f\ x)}})}}}}$
 $\text{INC NO} \Rightarrow \text{N1}$
 $\text{INC N2} \Rightarrow \text{N3}$
 $\text{INC N3} \Rightarrow \text{N4}$

Example:

```

eval inc_zero :
  INC ZERO
=> ( $\lambda n\ .\ \lambda f\ .\ f\ (\underline{\underline{\lambda x\ .\ f\ (f\ x)}})$ ) ZERO
=>  $\lambda f\ .\ f$  (ZERO f x)
=>  $\lambda f\ .\ f$ 
=> ONE

```

Does this function look familiar?

$\text{-- Call ‘f’ on ‘x’ one more time than ‘n’ does}$

$\text{let INC = } \underline{\underline{\lambda n\ .\ \underline{\underline{\lambda f\ .\ f\ (\underline{\underline{\lambda x\ .\ f\ (f\ x)}})}}}}$

$\text{INC NO} \Rightarrow \text{N1}$

$\text{INC N1} \Rightarrow \text{N2}$

$\text{INC N2} \Rightarrow \text{N3}$

$\text{INC N3} \Rightarrow \text{N4}$

\dots

$\text{INC Nn} \Rightarrow \text{Nn+1}$

$\text{INC Nn+1} \Rightarrow \text{Nn+2}$

$\text{INC Nn+2} \Rightarrow \text{Nn+3}$

$\text{INC Nn+3} \Rightarrow \text{Nn+4}$

\dots

$\text{INC Nn+m} \Rightarrow \text{Nn+m+1}$

$\text{INC Nn+m+1} \Rightarrow \text{Nn+m+2}$

$\text{INC Nn+m+2} \Rightarrow \text{Nn+m+3}$

$\text{INC Nn+m+3} \Rightarrow \text{Nn+m+4}$

\dots

$\text{INC Nn+m+k} \Rightarrow \text{Nn+m+k+1}$

$\text{INC Nn+m+k+1} \Rightarrow \text{Nn+m+k+2}$

$\text{INC Nn+m+k+2} \Rightarrow \text{Nn+m+k+3}$

$\text{INC Nn+m+k+3} \Rightarrow \text{Nn+m+k+4}$

\dots

$\text{INC Nn+m+k+l} \Rightarrow \text{Nn+m+k+l+1}$

$\text{INC Nn+m+k+l+1} \Rightarrow \text{Nn+m+k+l+2}$

$\text{INC Nn+m+k+l+2} \Rightarrow \text{Nn+m+k+l+3}$

$\text{INC Nn+m+k+l+3} \Rightarrow \text{Nn+m+k+l+4}$

\dots

$\text{INC Nn+m+k+l+m} \Rightarrow \text{Nn+m+k+l+m+1}$

$\text{INC Nn+m+k+l+m+1} \Rightarrow \text{Nn+m+k+l+m+2}$

$\text{INC Nn+m+k+l+m+2} \Rightarrow \text{Nn+m+k+l+m+3}$

$\text{INC Nn+m+k+l+m+3} \Rightarrow \text{Nn+m+k+l+m+4}$

\dots

$\text{INC Nn+m+k+l+m+n} \Rightarrow \text{Nn+m+k+l+m+n+1}$

$\text{INC Nn+m+k+l+m+n+1} \Rightarrow \text{Nn+m+k+l+m+n+2}$

$\text{INC Nn+m+k+l+m+n+2} \Rightarrow \text{Nn+m+k+l+m+n+3}$

$\text{INC Nn+m+k+l+m+n+3} \Rightarrow \text{Nn+m+k+l+m+n+4}$

\dots

$\text{INC Nn+m+k+l+m+n+k} \Rightarrow \text{Nn+m+k+l+m+n+k+1}$

$\text{INC Nn+m+k+l+m+n+k+1} \Rightarrow \text{Nn+m+k+l+m+n+k+2}$

$\text{INC Nn+m+k+l+m+n+k+2} \Rightarrow \text{Nn+m+k+l+m+n+k+3}$

$\text{INC Nn+m+k+l+m+n+k+3} \Rightarrow \text{Nn+m+k+l+m+n+k+4}$

\dots

$\text{INC Nn+m+k+l+m+n+k+l} \Rightarrow \text{Nn+m+k+l+m+n+k+l+1}$

$\text{INC Nn+m+k+l+m+n+k+l+1} \Rightarrow \text{Nn+m+k+l+m+n+k+l+2}$

$\text{INC Nn+m+k+l+m+n+k+l+2} \Rightarrow \text{Nn+m+k+l+m+n+k+l+3}$

$\text{INC Nn+m+k+l+m+n+k+l+3} \Rightarrow \text{Nn+m+k+l+m+n+k+l+4}$

\dots

$\text{INC Nn+m+k+l+m+n+k+l+n} \Rightarrow \text{Nn+m+k+l+m+n+k+l+n+1}$

$\text{INC Nn+m+k+l+m+n+k+l+n+1} \Rightarrow \text{Nn+m+k+l+m+n+k+l+n+2}$

$\text{INC Nn+m+k+l+m+n+k+l+n+2} \Rightarrow \text{Nn+m+k+l+m+n+k+l+n+3}$

$\text{INC Nn+m+k+l+m+n+k+l+n+3} \Rightarrow \text{Nn+m+k+l+m+n+k+l+n+4}$

\dots

</

No!

- Named terms in Elsa are just syntactic sugar
- To translate an Elsa term to λ -calculus: replace each name with its definition

```
\n -> ITE (ISZ n)
      ZERO
      (ADD n (SUM (DEC n))) -- But SUM is not yet defined!
```

Recursion:

- Inside *this* function
- Want to call the *same* function on `DEC n`

Looks like we can't do recursion!

- Requires being able to refer to functions *by name*,
- But λ -calculus functions are *anonymous*.

Right?

λ -calculus: Recursion

Think again!

Recursion:

Instead of

- Inside *this* function I want to call the *same* function on `DEC n`

Lets try

- Inside *this* function I want to call *some* function `rec` on `DEC n`
- And BTW, I want `rec` to be the *same* function

Step 1: Pass in the function to call “recursively”

```
let STEP =
  \rec -> \n -> ITE (ISZ n)
    ZERO
    (ADD n (rec (DEC n))) -- Call some rec
```

Step 2: Do some magic to `STEP`, so `rec` is itself

```
\n -> ITE (ISZ n) ZERO (ADD n (rec (DEC n)))
```

That is, obtain a term `MAGIC` such that

```
MAGIC =*> STEP MAGIC
```

Once we have it, we can define:

```
let SUM = FIX STEP
```

Then by property of `FIX` we have:

```
SUM =*> FIX STEP =*> STEP (FIX STEP) =*> STEP SUM
```

and so now we compute:

```
eval sum_two:
  SUM TWO
  =*> STEP SUM TWO
  =*> ITE (ISZ TWO) ZERO (ADD TWO (SUM (DEC TWO)))
  =*> ADD TWO (SUM (DEC TWO))
  =*> ADD TWO (SUM ONE)
  =*> ADD TWO (STEP SUM ONE)
  =*> ADD TWO (ITE (ISZ ONE) ZERO (ADD ONE (SUM (DEC ONE))))
  =*> ADD TWO (ADD ONE (SUM (DEC ONE)))
  =*> ADD TWO (ADD ONE (SUM ZERO))
  =*> ADD TWO (ADD ONE (ITE (ISZ ZERO) ZERO (ADD ZERO (SUM DEC ZERO))))
  =*> ADD TWO (ADD ONE (ZERO))
  =*> THREE
```

How should we define `FIX` ???

The λ combinator discovered by Haskell Curry:

```
let FIX = \stp -> (\x -> stp (x x)) (\x -> stp (x x))
```

How does it work?

```
eval fix_step:
  FIX STEP
  =*> (\stp -> (\x -> stp (x x)) (\x -> stp (x x))) STEP
  =*> (\x -> STEP (x x)) (\x -> STEP (x x))
  =*> STEP (\x -> STEP (x x)) (\x -> STEP (x x))
  -- ^^^^> ^^^^ this is FIX STEP ^^^^> ^^^^
```

That's all folks, Haskell Curry was very clever.

Next week: We'll look at the language named after him ([Haskell](#))
